Magpie #1924 - IMAP caller-ID validation

AI-generated report prepared with Codex (GPT-6), reviewed with Claude (Opus 5.5).

Summary of retained results from hosted Linux Docker; this page is not a fresh terminal execution.

Source: apache/magpie `ff82fd3544ae52005f3aefea0c29b69948639537`.

Run: https://github.com/leninworld/magpie/actions/runs/41250252481

Environment: Linux x86-64, Python 3.12.13, non-root Docker, 2 CPUs, 10 GiB memory limit.

Regression and package checks

Check	Recorded result
Original package baseline	31 passed; no failures, errors or skips
New regression subset with original production code	11 expected failures among 30 cases; no errors or skips
Full corrected package	63 passed; no failures, errors or skips
All non-manual hooks	Passed, including workspace Ruff, format and mypy
Actual affected-member selection and workspace pytest hook	Passed; selector chose tools/mail-source/imap only
Separate zizmor audit	Passed in default offline mode (1 ignored, 18 suppressed)
Source distribution and wheel	Both built successfully offline
Installed wheel API and real console entry point	Passed in a separate environment outside the source directory

Corrected behavior checked in the installed package

These are recorded assertions, not reconstructed stdout:

- `read_thread` accepts `report@example.org` and returns the same result as `<report@example.org>`, with a bracketed output ID.

- `create_draft` accepts the bare ID, returns the bracketed ID and keeps `sent` false.

- URL resolution gives the same result for bare and bracketed IDs.

- The real installed `imap-source-thread-url` console command succeeds for both forms and returns `imap://imap.example.org/INBOX;MSGID=report%40example.org`.

- The module was imported from the installed wheel's site-packages, rather than the source checkout.

Mail was synthetic, using the package's existing FakeMailbox fixture. No live IMAP server, real mailbox, native macOS or Windows behavior was tested. Header parsing and the separate missing-root recipient/subject question (#1925) are unchanged.

Final tested patch SHA256: `edbef3f2e5c07b51aba81b1132fed4b312478ad71948f952344a4558487ec9fb`.

All 12 final file hashes were checked. The four test-file formatting changes preserve their Python ASTs.

The owned validation container exited successfully, was verified stopped and was not OOM-killed.

Faithful PDF view of the approved public report at fc31213b. No new execution or validation is claimed.
